

Input RIP Process Post-RIP Process

General/Normal Mode

RGB Workflow

- Default color space: **sRGB**, optimal for office applications and direct photo printing. **Adobe RGB** is often used by designers working in the Adobe Creative Suite.
- **Use Embedded Profile** (default on iGen4): This option honors the intent of designers who associate profiles with their photo/images.
- For RGB black/gray text and graphics, use the **RGB to Black** option to force printing with K only (not applicable when using embedded profile or to images).
 - "Black uses K" is applicable when R=G=B=0
 - "Black and Gray use K only" is applicable when R=G=B
- **Automatic Image Enhancement** is not supported with APPE in v8.

CMYK Workflow

- **Direct CMYK**
 - Uses the full printer gamut with no color management. This can be used to achieve the richest color (especially for text and graphics).
 - Supports a workflow where color management is applied upstream.
- Default color space: **GRACoL (v7)**, provides optimal color balance for traditional CMYK workflows and offset press emulation. Additional common standards are built-in for regional and shop-specific preferences.
- Add new CMYK profiles via the **Color Manager** to emulate specific devices, and the system dynamically creates a DeviceLink.
- DeviceLink technology insures black preservation.

Grayscale Processing

- Grayscale data is printed as K-only; profiles adjust the contrast level.
 - Default **Images: Gamma 1.8**
 - Default **Text/Graphics: <Printer> Gray (Direct)**
- If **Color Mode → Grayscale** is selected, all data is rendered with K only.

Using Embedded Color Management (Embedded Profiles)

- To honor embedded profiles, check the **Use Embedded Profile** box for the applicable Source Color Space.
- Embedded profiles generally do not use DeviceLink, therefore the CMYK black channel is not preserved.

Spot Color Processing

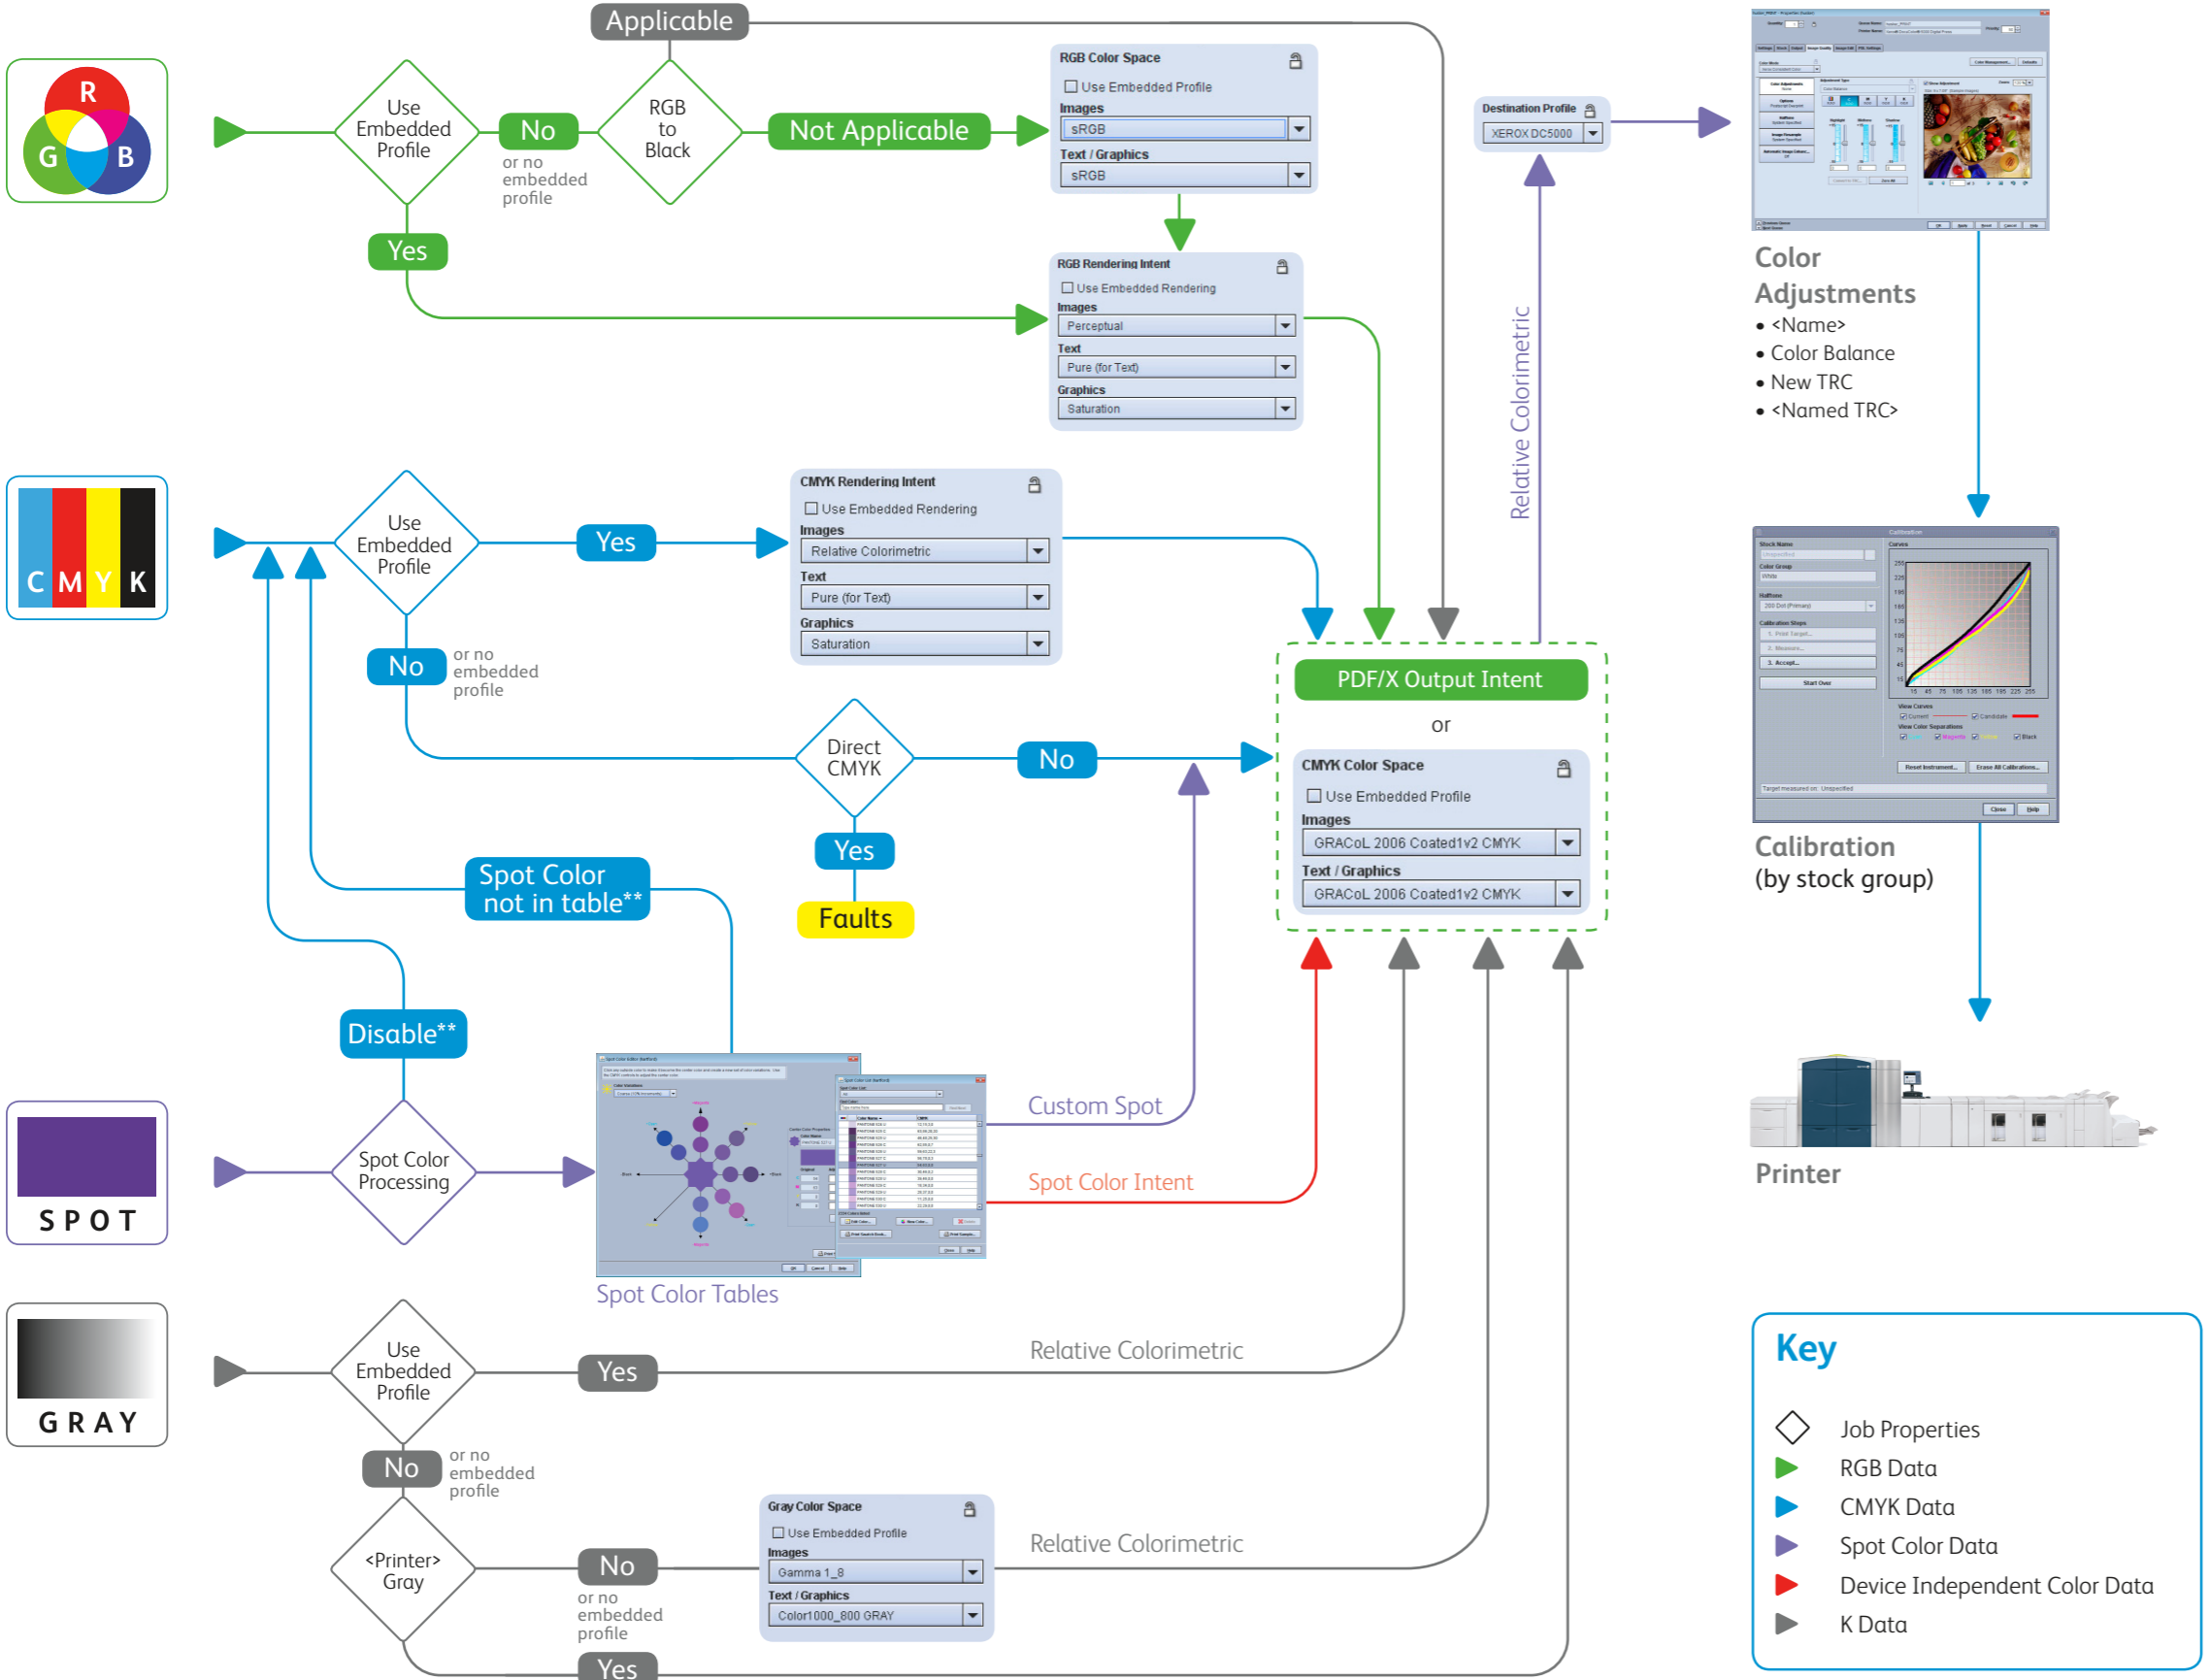

- FreeFlow Print Server is PANTONE® licensed. PANTONE® PMS and GOE colors will be rendered using Pantone L*a*b* aims, with the current **Destination Profile**.
- Spot colors can be fine tuned with the visual **Spot Color Editor**. Custom named colors can also be added. Edited or custom colors will print using the CMYK specified in the Editor.
- If the spot color name is not found in the table, or **Spot Color Processing is Disabled**, the alternative color definition is used. The chart depicts typical scenario, in which alternative color is CMYK.

Rendering Intents

Same as PostScript/Legacy PDF.

**Alternative color definition is used. CMYK (shown) is commonly used.

Input RIP Process Post-RIP Process

Adobe PDF Print Engine's Printer Emulation Mode

- Optimizes consistency between devices
- In effect when any of the following FreeFlow Print Server Color Management options are selected:
 - RGB Emulation "On"
 - Color Mode → Xerox Consistent Color
 - Process as PDF/X (checkbox selected)

Note: Page exceptions for these settings are ignored; entire job is processed in either normal or printer emulation mode.

- Uses two-stage processing:
 - All content—RGB, CMYK, Gray, Spot, L*a*b*—is normalized to the emulated CMYK space, then rendered in printer CMYK via the Destination Profile.

RGB Emulation

- "Off": Normal color flow, color optimized for printer
- "On": Enable emulation mode.

- The emulated CMYK space is defined by the CMYK Color Space selected for the job/page.

Xerox Consistent Color Mode

- Sets RGB Emulation "On", thus engaging emulation mode
- Enforces default RGB & CMYK settings, restricts Color Adjustments
- Spot Color Processing "Disabled"

– Alternative color definition (rather than PANTONE L*a*b* value) is rendered to the emulation space

Process as PDF/X

- Ensures compliance (PDF/X-1a, PDF/X-3, or PDF/X-4)
 - If the file defines PDF/X Output Intent, that defines the emulated CMYK space.
 - If the file does not have a PDF/X Output Intent, the emulated CMYK space is defined by the CMYK Color Space selected for the job/page.
- Enforces use of embedded profile, embedded rendering intent, and overprint. (not shown in properties display as does not apply to non-PDF)

**Alternative color definition is used. CMYK (shown) is commonly used.
